

MTU Callosum_MC

Electrical Power Management System (EPMS)

Page 1/4

The EPMS is an optional system and functions in conjunction with MTU Callosum_MC. The EPMS is a highly flexible electric power management system covering a large range of medium and complex applications. EPMS is able to control and protect up to 15 generators (diesel or shaft generator) and additional breakers (shore, bus tie).

- Engine control
- Generator protection
- Synchronisation
- Load-sharing
- etc.

Benefits

Powerful hard- and software

Customized system solution

Simple addition of I/O-signals and software functions possible

Compact hardware, easy to install

Power. Passion. Partnership.

MTU Callosum_MC

Electrical Power Management System (EPMS)

Page 2/4

MTU Callosum_MC structure

Characteristics

- Different plant modes (auto, semi-auto ...)
- Advanced power management functions
 - load dependent start / stop of diesel generators
 - symmetrical and asymmetrical load sharing
 - programmable start priority
 - heavy consumer control
 - trip of non-essential load groups (up to 10)
- Blackout start sequence
- Control of emergency generators
- Change-over from onboard to shore supply and vice versa without interruption of power supply
- Active speed and voltage control
- Automatic synchronization of power breaker
- Various breaker and bus bar protection ($P>$, $P<$, $I>$, $U>$, $U<$, $f>$, $f<$, $Q>$, $Q<$)
- Up to three operation panels per generator
- Shore power feeding
